SAP EWM Online Training

SAP EWM Online Training

Description

This SAP EWM Online Training SAP Warehouses EWM S/4 Hana aims to turn the student into a user of the different functionalities of EWM on SAP/4 HANA. You will learn about its organizational structure, master data, main transactions, use of the monitor or radio frequency.

SAP S/4HANA is the new version of the SAP platform that has been implemented as a widespread management tool in medium and large companies, succeeding SAP R/3 and SAP ERP.

You will receive training in [SAP S/4HANA Warehouse Management](#) at the expert user level, through a program made up of eminently practical thematic units and with the support of a team of professional teachers in the eld.

With exclusive video-class technology, accompanied by online theoretical material, you will be trained in the Warehouse Management (EWM) module, learning step by step everything related to business processes in this area.

 You will nd detailed de nitions and listings of organizational information, master data , and each speci c process, along with the corresponding activities and comments .

 Today, SAP expert pro les are among the most sought-after and best-paid in the job market. Don't miss the opportunity to stand out from other candidates by demonstrating your knowledge of SAP S/4HANA, the new generation of SAP's Business Suite for ERP.
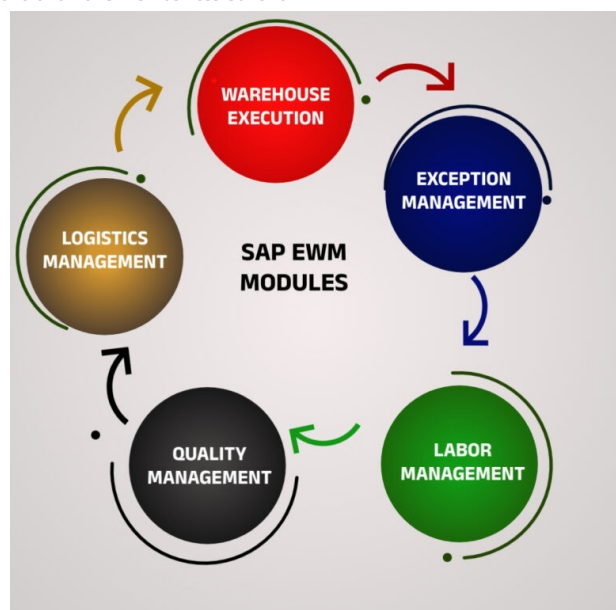

career opportunities

There is currently a high demand for SAP Consultants from large and medium-sized companies. SAP has more than 18 million users, making it the leading supplier of software for the management of large and medium-sized companies.

According to the INE (National Institute of Statistics), more than 40,000 SAP consultants will be hired in the next 4 years. The SAP corporation has developed to become the fth largest software company in the world.

This training will make you an expert SAP Warehouse Management (EWM) Consultant, which will automatically put you in an advantageous position to work in SAP consultancies or [SAP EWM Online Training](#) as an in-house SAP Consultant in companies that use SAP to manage human resources.

SAP Extended Warehouse Management (EWM) modules have become an integral part of many organizations' warehousing and distribution operations.

EWM solutions greatly simplify ICT environments and reduce the total cost of logistics management. User engagement and productivity are also improved through a single management solution and a common user experience across all aspects of ERP and warehouse management.

Who is it for?

This EWM online training SAP Warehouses EWM S/4 Hana EWM (Warehouse Management) is aimed at professionals with knowledge in warehouse and/or stock and budget management who wish to enter the SAP world. Also for warehouse managers, administrators and other professionals who, having experience in other management software, wish to justify their knowledge of SAP and, in general, to all those who are interested in developing their professional career in the area of warehouse management of a medium or large company, where SAP has been implemented as a widespread management tool.

SAP Extended Warehouse Management (SAP EWM) module

The SAP Extended Warehouse Management (SAP EWM) module within the SAP ERP system is a comprehensive solution that enhances and extends warehouse management module capabilities beyond those provided by traditional warehouse management (SAP WM) module. We focus on improving warehouse operations by providing advanced warehouse management, inventory management, order ful lment and resource optimisation capabilities. This allows companies to increase the transparency, ef ciency and accuracy of warehouse processes, and warehouse management ,enabling real-time tracking of Materials movements, ef cient picking strategies and optimised resource utilisation. EWM is designed to integrate seamlessly with other SAP modules like SD, FICO and MM to provide a complete solution for end to end supply chain management.

SAP Extended Warehouse Management (SAP EWM) is used to ef ciently manage inventory in the Warehouse and for supporting processing of goods movement. It allows the company to control their Warehouse inbound and outbound processes and movement of stocks in the Warehouse.

The main process in a Warehouse is incoming and outgoing materials, goods receipt and goods issue, ful l customer orders, and distribution of goods and materials. When a company doesn't store any goods, then there is no need of Warehouse management to manage goods items.

Inbound process involves storage of goods items in warehouse and their location and Outbound process involves picking up the goods. Whenever a material is stored in a warehouse, it is stored in the storage bin and you can nd its current location and tack the status also.

With the help of SAP EWM all the goods movements are controlled by warehouse management system and provides you the tools to monitor warehouse activities and tracking. You can also manage additional functions in the Warehouse like creating a serial number, batch number, vendor management inventory, resource optimisation and value added services. SAP Extended Warehouse Management (SAP EWM) allows you , not only monitor the quantity of goods in Warehouse but to manage other critical functions and delivery of goods ef ciently.

Warehouse Management is opposite to Inventory management. SAP Warehouse management deals with goods movement and monitoring the physical location of the goods recorded with speci c documents.

SAP EWM is different from SAP WM (Warehouse Management)

SAP EWM is a part of SAP Supply Chain Management like SAP Warehouse management system but provides more robust and advanced features to manage key activities in the Warehouse.

SAP Extended Warehouse Management is similar to Warehouse management but it provides more advanced features like picking, put away, RF framework, Warehouse structure and more exible options to manage the warehouse functions.

SAP WM (Warehouse Management) add-on is available in SAP ECC , and SAP S4 HANA EWM is available in S4 HANA, From S4 HANA 2020 version onwards Embedded EWM Is available.

You can create new elements like an activity area, resources, labor management and work centers in SAP EWM which were not available in SAP WM.

SAP EWM training provides more best solution to manage warehouse functions in an organisation. It is also a part of SAP Supply Chain Management and also supports all the processes within logistics and supply chain management.

Process EWM module

The processes of the SAP EWM (Extended Warehouse Management) module include three main concepts :

1) Inbound Process

2) Outbound Process

3) Physical Inventory Process

Together, these three processes form the core functionality of SAP EWM, ensuring ef cient warehouse management, accurate inventory management and optimised supply chain operations and tracking.

Inbound Process

The Inbound Process in the SAP EWM course (SAP EWM) module refers to all the activities involved in manage the ow of goods items into the warehouse. This includes process of incoming shipments, unloading, performing quality checks and placing orders in designated storage locations within the warehouse.

The main components of this process :

- Goods Receipt: Begins at goods receipt, where the system registers the destination of the product at the warehouse. This stage involves con rming receipt of goods items for incoming deliveries.
- Handling and storage: Once goods items have been received, products are often unloaded from incoming vehicles. The SAP EWM system manages the unloading process the place of goods into predetermined storage locations within the warehouse.

- Quality control: SAP Extended Warehouse Management handles the quality control processes for incoming products. This involves checking incoming goods with   predetermined quality standards. Depending on the results of the inspection, goods may be rejected, accepted or
- agged based inspection.
  Decomposition: When products are received in consolidated shipments, the receiving process may include decomposition, which involves
- dividing larger shipments   into individual large items or smaller items units for more ef cient storage type and handling.
- Handling units: SAP EWM enables the management of handling units, which are goods materials.
  Cross docking: SAP Extended Warehouse Management supports cross docking, a strategy in which incoming goods are immediately transfer from the receiving area   to the shipping area without need for storage. This strategy used to speed up the ful lment of customer orders. The incoming process in SAP EWM is tightly   integrated with other SAP modules, such as SAP Materials Management and SAP Sales & Distribution , ensuring a seamless and consistent   ow of data throughout   the ERP process.

Outbound Process

The outbound process in the SAP EWM (Extended Warehouse Management) module refers to all the activities and procedures involved in managing the   ow of goods out of   the warehouse and tracking. It encompasses the processes of order ful lment, item picking and packing, and delivery of products to customers. The key components of the   outbound process in SAP EWM are as follows :

Outbound order processing : the process begins with the receipt of outbound orders from SAP SD (Sales and Distribution) or other relevant modules. Outbound orders can   include sales orders, delivery orders.

Order Con rmation : Once the outbound orders have been received, the SAP EWM system con rms stock availability and con rms the order. This step involves check the   inventory to ensure that the requested items are in stock and can be allocated to the outbound order.

Picking : The picking process involves selecting items from their storage location according to the requirements of the outbound order. SAP EWM supports various selection   strategies, such as wave selection, cluster selection and zone selection, to optimize the selection process and increase ef ciency.

Packaging : The Packaging after collection, items are packaged using appropriate packaging materials. SAP EWM enables the management of packaging materials and   supports packaging processes that may include the consolidation or separation of items according to speci c business requirements.

Handlers : SAP EWM manages handlers during the shipping process, ensuring that items are correctly grouped and packed for shipment. Handling units can include pallets   other containers.

Loading : Once items have been packed next step is the loading process. SAP EWM helps to optimize loading by providing advice on loading sequences and ensuring that the   right items are loaded onto the right transport vehicle.

Shipping : Shipping process ends with the goods being transported to the designated location. SAP EWM integrates with carriers and shipping

Physical Inventory Process

The Physical Inventory process in the SAP Extended Warehouse Management (SAP EWM) module involves systematically counting and verifying the actual stock level in   the warehouse and matching it with the inventory recorded in the system. This process is essential for maintaining accurate inventory records and identifying   discrepancies and ensuring reliable supply chain operations. A key element of the inventory process in SAP EWM is 'count and control'.

EWM (Extended Warehouse Management)

[SAP EWM course online](#) is applied to ef ciently manage inventory in the Warehouse and for supporting the processing of goods movement. It allows the company to control   its Warehouse inbound and outbound processes and the movement of goods in the Warehouse and tracking.

The main method in a Warehouse is incoming and outgoing goods materials, goods receipt and goods issue, ful ll customer orders and distribution of goods items. When a   company doesn't store any goods, then there is no need for Warehouse management to manage goods items.

The inbound process includes the storage of goods in the warehouse and their location and the Outbound process includes picking up the goods items. Whenever a material   is stored in a warehouse, it is stored in the storage bin and you can nd its current location and tracking also.

With the help of SAP EWM (Extended Warehouse Management), all the goods items movement is controlled by a warehouse management system and provides you the tools   to monitor warehouse activities. You can also manage additional functions in the Warehouse like creating a serial number, batch number, vendor management inventory,   resource optimisation, and value added services. SAP Extended Warehouse Management enables you to monitor the number of goods in the Warehouse but to manage other   critical functions and delivery of goods items ef ciently.

Key Features of SAP Extended Warehouse Management

The following are the key features of SAP EWM –
- Using EWM, you can perform the warehouse activities like picking, posting, and managing storage box and good receipts and tracking also.
- You can determine storage concepts applying to slot for product items and optimise the arrangement of goods items warehouse automatically.
- It allows you to control and track vehicles as well as other transportation units from the terminal check-in to yard check-out, including movements and other tasks   within the yard.
- EWM also includes storage and handling of hazardous substances and their transportation by the regulations from SAP Environmental Health & Safety EHSM and   EHS.
- You can perform consolidation of handling units that contain different products before putting them away in different storage locations and sections.
- It allows you to perform executable tasks like work packages, existing of warehouse tasks warehouse employees should perform as part of warehouse management   activities.

- You can set an alert for changed data before goods receipt from SAP EWM to the ERP system, reversal or correction of the receipt of the goods from SAP EWM to the ERP system, and an inbound delivery split from SAP EWM to the ERP system.

- In SAP EWM, you can also plan labour time schedule and use resources more effectively, and hence you can make your Warehouse efficient by managing key resource management tasks effectively and monitor the tracking.

- You can use cross docking that allows you to perform transportation of handling units across different distribution centres or warehouses till they reach their Destination location in the Warehouse.
